

CSC 1051: Full-Stack Fundamentals Laboratory

LAB Practical 1

Campus News | HTML activity: 20–30 minutes

Your task

Recreate the Campus News webpage shown in the reference using HTML only. Save your work as news.html. Use the same short text and order as the reference.

Do not use CSS or JavaScript. Include the image, both lists, the table with borders, and the university link.

Tag bank

Page setup

```
<!DOCTYPE html> <html> <head> <meta> <title> <body>
```

Headings

```
<h1> <h2> <h3>
```

Text and breaks

```
<p> <br> <hr>
```

Lists

```
<ul> <ol> <li>
```

Table

```
<table border="1"> <tr> <th> <td>
```

Image

```

```

Link

```
<a href="https://www.sjp.ac.lk/">
```

For this HTML-only exercise, use border="1". This is an older HTML attribute; modern websites use CSS for table borders.

Image file

Use the provided image named university.jpg. Keep it in the same folder as news.html. The src attribute gives the file path, alt describes the image, and width sets its displayed width.

Repository and submission

After completing the HTML activity:

1. Create a PUBLIC GitHub repository for "Full-Stack Fundamentals Laboratory". Use Full-Stack-Fundamentals-Laboratory as the repository name (hyphens replace spaces).
2. Inside the repository, create a folder named exactly "Lab Practical 1". Place news.html and the provided university.jpg inside this folder.

Required folder structure:

```
Full-Stack-Fundamentals-Laboratory/
  Lab Practical 1/
    news.html
    university.jpg
```

3. Use VS Code to stage the two files, commit them with a relevant message, and push the commit to your public GitHub repository.

Example commit message: Add Lab Practical 1 webpage and image

4. Open the repository on GitHub and check that both files appear inside Lab Practical 1 and that the repository is public.

Before you finish

Open news.html in a browser. Check the headings, image, both lists, table borders, and link. Keep your code neatly indented.

Independent practical

Write the HTML yourself. Do not submit AI-generated code. You should be able to explain each tag you use.

AI assistance: explain concepts or give hints only; do not generate the completed practical.
